Objective

The objective of this analysis is to quantify the incremental construction cost, energy cost savings, and percent energy cost savings associated with constructing a house compliant with the 2012 IECC relative to a 2006 IECC baseline. A methodology established by the NAHB Research Center was used to determine the incremental energy cost savings. A cost effectiveness analysis was also performed using both the 2006 and 2009 IECC as a baseline to illustrate incremental paybacks in an analysis with different baselines.

Background

A strong push was made by many advocacy groups, including the U. S. Department of Energy (DOE), to increase the stringency of the 2012 International Energy Conservation Code (IECC) to achieve a 30 percent energy savings relative to the 2006 IECC. This effort resulted in a number of major changes which impact both energy savings and construction costs for residential construction.

Energy Evaluation Methodology

A methodology was developed by the NAHB Research Center (NAHB Research Center 2012-1) to calculate energy savings with 2006 IECC as the primary baseline. This methodology defines a *Standard Reference House*, including the building configuration and energy performance parameters. In addition, a calculation formula was included to determine a “percent energy savings” when comparing editions of the energy code. Energy performance parameters from the IECC were used where available. For parameters not defined in the IECC, DOE’s Building America Benchmark (Hendron 2008) protocols were used.

Standard Reference House

The building geometry (Figure 1) used in this analysis is documented in the methodology paper and was developed using the NAHB Research Center’s 2008 and 2009 Annual Builder Practices Survey (ABPS) results. The parameters represent the average (mean) values from the ABPS for building areas and features not dictated by the 2006 IECC. Table 1 lists floor, attic, wall, and window areas used in the *Standard Reference House*.

Table 1. Average Wall and Floor Square Footage

| | Annual Builder Practices Survey (ABPS) | Standard Reference House |
|----------------------------------------|----------------------------------------|--------------------------|
| 1 st Floor CFA | 1,780 | 1,776 |
| 2 nd Floor CFA | 572 | 576 |
| Total CFA (w/o Conditioned Basement) | 2,352 | 2,352 |
| Slab/Basement/Crawl Floor Area | | 1,776 |
| Total CFA (with Conditioned Basement) | | 4,128 |
| Attic Floor Area | | 1,776 |
| 1 st Floor Wall Area | 2,006 | 1,764 |
| 2 nd Floor Wall Area | 586 | 816 |
| Total Above-Grade Wall Area | 2,592 | 2,580 |
| Basement Wall Area (8ft wall height) | | 1,568 |
| Crawlspace Wall Area (4ft wall height) | | 784 |
| Window Area (18%/15%) | | 464/387 |

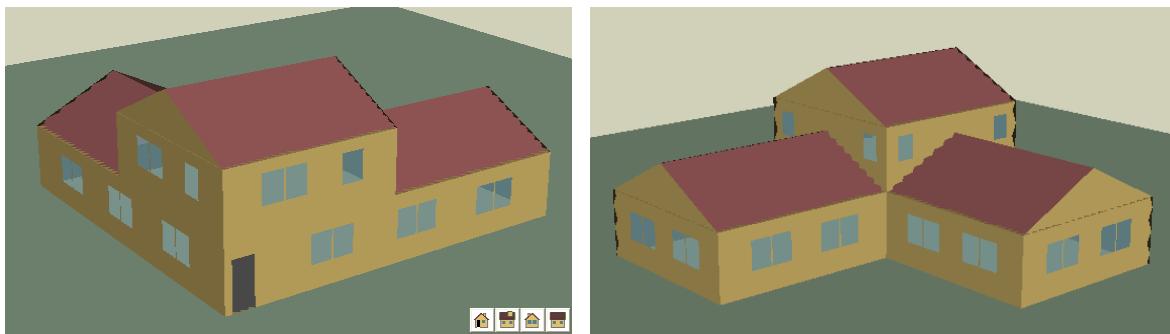

Figure 1: Simulation Model of Standard Reference House

Representative Cities

Eight cities (Table 2) representing each of the DOE Climate Zones (Figure 2) were selected to quantify energy savings for their respective climates.

Table 2: Representative Climate Zone Cities

| Climate Zone | Moisture Region | State | City | HDD(65) | CDD(65) |
|--------------|-----------------|-----------|-----------|---------|---------|
| 1 | Moist | Florida | Miami | 120 | 4,396 |
| 2 | Dry | Arizona | Phoenix | 977 | 4,790 |
| 3 | Moist | Tennessee | Memphis | 2,851 | 2,221 |
| 4 | Moist | Maryland | Baltimore | 4,460 | 1,314 |
| 5 | Moist | Illinois | Chicago | 6,174 | 911 |
| 6 | Dry | Montana | Helena | 7,474 | 353 |
| 7 | N/A | Minnesota | Duluth | 9,371 | 185 |
| 8 | N/A | Alaska | Fairbanks | 12,818 | 49 |

Note: HDD and CDD data from TMY3 Dataset

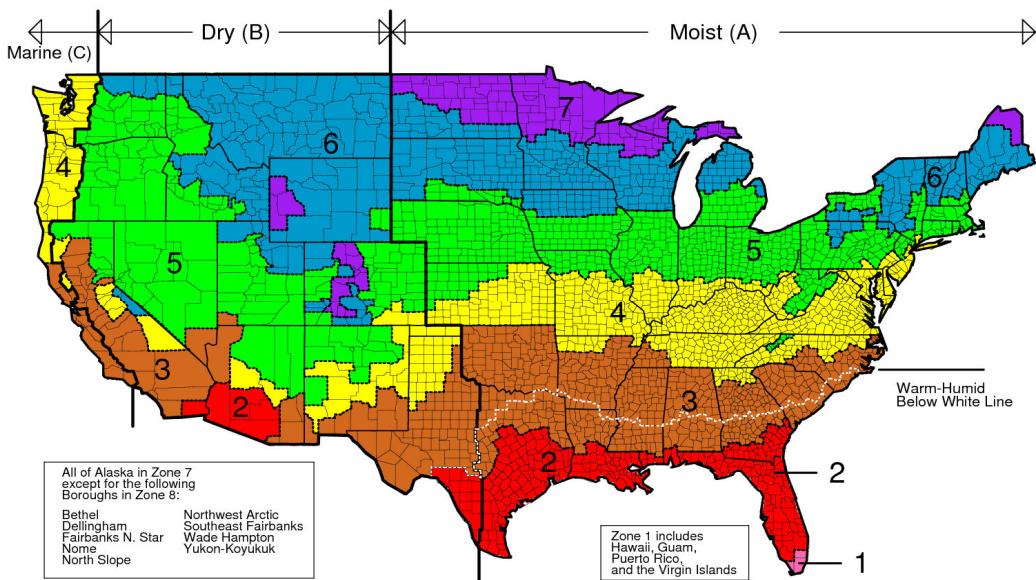

Figure 2: DOE Climate Zone Map

Weighted Averaging

Weighted averaging was applied both within and across climate zones. Within climate zones, wall construction factors for light-framed and mass walls, as well as various foundation types (slab, crawlspaces, and basements), were applied based on how new homes are constructed as determined by the NAHB Research Center's Annual Builder Practices Survey (ABPS). Once the savings within a climate zone were determined, a weighted calculation according to building starts (Briggs 2002) for each climate zone was performed in order to obtain a national average.

Changes and Cost Impacts of the 2012 IECC

A number of major changes were made from the 2006 IECC to the 2012 IECC. For the first time, performance testing for whole building tightness is now mandated in the IECC. Lighting requirements were added to the scope of the IECC in 2009 and further increased in 2012. The largest cost increases have been due to the changes in wall insulation requirements which affected six of the eight climate zones. Also added was a prescriptive requirement mandating insulation on the hot water pipes for specific locations and on all pipes exceeding specified lengths.

Appendix A includes the baseline 2006 IECC prescriptive table and Appendices B and C contain the 2009 and 2012 IECC prescriptive tables, respectively, with highlighted changes from the 2006 edition. Table 3 shows the incremental cost for changes made between the 2006 and 2012 IECC specified by climate zone. All costs listed below are based on a unit basis and totals for the *Standard Reference House*. Costs from the ASHRAE RP-1481 have been escalated for inflation using RS Means adjustment factors.

Construction Costs Associated with 2012 IECC Changes

Each climate zone has different requirements; consequently, the resulting incremental construction costs to comply with the 2012 IECC vary between climate zones. The cost increases (Table 4) range from a high of \$8,871 in Climate Zone 3 to a low of \$4,499 in Climate Zone 2, with a national weighted average cost increase of \$7,034. Complete cost analysis details on the individual measures for each climate zone can be found in Appendix D.

Calculated Energy Usage

Table 4 summarizes the calculated energy usage for a house built to the minimum requirements of both the 2006 and 2012 IECC. The following nomenclature is used to categorize the energy use:

TEU_{2006} = Total Energy Usage using the 2006 IECC

TEU_{2012} = Total Energy Usage using the 2012 IECC

$HCWU_{2006}$ = Heating, Cooling, and Water heating energy Usage using the 2006 IECC

Energy cost savings are calculated using the Energy Information Administration's calendar year 2011 consumer price data for electricity (\$0.118/kWh) and natural gas (\$1.08/therm).

It is necessary to convert electric (kWh) and natural gas (Therm) energy usage into Btu's in order to determine the site and source energy usage. The site to source multipliers to obtain source Btu's are 3.365 for electricity and 1.092 for natural gas (Hendron 2008).

Table 3: Itemized 2012 IECC Incremental Construction Cost over 2006 IECC

| Affected Climate Zone(s) | Item | Code Requirement | | Cost | | | Source |
|--------------------------|------------------------|------------------|------------|-----------|---------------|-----------|------------------|

|---------------------------|----------------------|--------|--------|-----------|-------------|----------|
| National Weighted Average | TEU ₂₀₀₆ | 17,499 | 715 | 131.2 | 279.0 | \$ 2,837 |
| | TEU ₂₀₁₂ | 13,723 | 505 | 97.3 | 212.7 | \$ 2,164 |
| | HCWU ₂₀₀₆ | 8,537 | 710 | 100.1 | 175.6 | \$ 1,774 |

Calculated Energy Savings

Energy savings are presented in three formats: 1) percent of site energy savings; 2) percent of source energy savings; and 3) percent of energy cost savings. Percent savings in Table 6 were calculated using a formula consistent with the PNNL/DOE presentation in various forums including the 2010 RESNET Conference (Taylor 2010):

$$\% \text{ Savings} = 100 * (\text{TEU}_{2006} - \text{TEU}_{2012}) / \text{HCWU}_{2006}$$

Table 6: 2012 IECC Energy Savings above the 2006 IECC

| Climate Zone | Site Btu Savings | Source Btu Savings | Energy Cost Savings |
|----------------------------------|------------------|--------------------|---------------------|
| 1 | 34.5% | 35.8% | 35.8% |
| 2 | 33.3% | 35.3% | 35.3% |
| 3 | 40.1% | 43.0% | 43.1% |
| 4 | 33.6% | 37.1% | 37.2% |
| 5 | 31.6% | 35.6% | 35.8% |
| 6 | 30.8% | 36.3% | 36.6% |
| 7 | 33.3% | 37.6% | 37.8% |
| 8 | 31.3% | 34.6% | 34.8% |
| National Weighted Average | 33.9% | 37.8% | 37.9% |

Cost Effectiveness

While various cost effectiveness evaluation criteria can be used, this analysis employs the simple payback method. The simple payback analysis is easy to understand and it does not make future assumptions such as general inflation rates, life expectancy of building components, or fuel escalation rates. Table 6 summarizes the energy cost savings, construction cost, and resulting simple payback for each climate zone by climate zone and a weighted national average.

The simple paybacks in Table 7 are based on an overall average for all changes in the 2012 IECC relative to a 2006 IECC baseline. Consequently, some changes result in shorter paybacks than the average simple payback and some in longer paybacks. This analysis did not calculate the individual payback period for each modification to the 2012 IECC.

Table 7: 2012 IECC Cost Effectiveness Relative to 2006 IECC

| Climate Zone | Annual Energy Savings | Incremental Construction Cost | Simple Payback (yrs) |
|----------------------------------|-----------------------|-------------------------------|----------------------|
| 1 | \$470 | \$4,521 | 9.6 |
| 2 | \$556 | \$4,499 | 8.1 |
| 3 | \$732 | \$8,871 | 12.1 |
| 4 | \$627 | \$8,072 | 12.9 |
| 5 | \$728 | \$5,872 | 8.1 |
| 6 | \$687 | \$8,734 | 12.7 |
| 7 | \$978 | \$8,403 | 8.6 |
| 8 | \$1,180 | \$8,403 | 7.1 |
| National Weighted Average | \$673 | \$7,034 | 10.4 |

Cost Effectiveness Using a 2009 IECC Baseline

The above analysis focused on construction costs and energy reduction associated with the 2012 IECC relative to a 2006 IECC baseline; however, it is important to understand that cost effectiveness decreases as energy requirements become more stringent, presuming the codes advance in a rational manner. Decreasing cost effectiveness becomes evident when comparing a defined code edition to varying baselines.

An analysis was performed using the same methodology comparing the 2006 IECC to the 2009 IECC (NAHB Research Center 2012-2). When code comparison results of the 2009 IECC analysis are compared with this analysis; the resulting difference in both energy savings and incremental cost are listed in Table 8. A national average incremental simple payback of 13.3 years was calculated when going from the 2009 IECC to the 2012 IECC as compared to the 10.4 years when using the 2006 IECC baseline, thus decreasing the cost effectiveness when evaluating the payback over the latest code cycle.

Table 8: 2012 IECC Cost Effectiveness Relative to 2009 IECC

| Climate Zone | Annual Energy Savings | Incremental Construction Cost | Simple Payback (yrs) |
|----------------------------------|-----------------------|-------------------------------|----------------------|
| 1 | \$206 | \$3,224 | 15.7 |
| 2 | \$294 | \$3,330 | 11.3 |
| 3 | \$470 | \$7,203 | 15.3 |
| 4 | \$410 | \$7,091 | 17.3 |
| 5 | \$505 | \$4,653 | 9.2 |
| 6 | \$397 | \$6,399 | 16.1 |
| 7 | \$609 | \$6,465 | 10.6 |
| 8 | \$725 | \$6,465 | 8.9 |
| National Weighted Average | \$427 | \$5,668 | 13.3 |

Conclusions

The energy savings calculation methodology used in this analysis provides detailed incremental construction cost, energy cost savings, percent energy savings, and a simple payback cost effectiveness analysis. The national average percent energy cost savings for the 2012 IECC over the 2006 IECC baseline is 37.9 percent (site energy savings 33.9 percent; source energy savings 37.8 percent). This result is significantly higher than many estimates which simply accept the 2012 IECC as 30 percent more efficient than the 2006 IECC.

The additional cost to construct to the 2012 IECC relative to the 2006 IECC is \$7,034 with the majority of the increase (\$5,668) associated with the changes between the 2009 and 2012 versions of the IECC.

Incremental simple payback from the 2006 to the 2012 IECC is 10.4 years; however, if the analysis only considers changes made from the 2009 edition of the IECC, the payback for adopting the 2012 IECC increases to 13.3 years.

R-Values are mins. U-Factors are max. R19 permitted in 2x6 cavity

b Applies to all Fenestration

c First is continuous, second is framing cavity

d R-5 shall be added to slab edge for heated slabs

e No SHGC for Marine zones

f Or insulation to fill the framing cavity, R-19 minimum

g First is cavity, second is sheathing
